

## **Criterion A: Initial investigation**

My client, Camille Fischer, is a veterinarian. She interacts with EMR software on a regular basis in her work.

Dr. Fischer is not fully satisfied with the usability of any of the different EMRs she uses. She finds it difficult to quickly find the information she needs. She commented on needing to manually search PDF documents to find certain information, saying that “I need to open several of them to find what I’m looking for”. There are also other tasks which she finds inefficient, such as the calculation of energy requirements and drug doses.

It is my hope that by creating a browser extension to automate the repetitive tasks my client performs every day, Dr. Fischer will be able to focus her attention less on her EMR software and more on the animals themselves.
